## Led tv backlight tester circuit diagram pdf

AliExpress.com Product - CCFL Tester Repair LCD TV Tube Tester Display Backlight Lamps Test 12V For Laptop Screen Repairing This is a backlight tester circuit. Imran Khan said it can test led tv backlight. You can make your own by following this circuit and it so simple. See or visit led plasma tv monitor repair on facebook. click this link: Get Images Library Photos and Pictures. I know my power supply is bad but want to build a LED tester to see if my LED's are good. If they are bad, I will stop any further work in trying to fix the TV since replacement LED strips are not available for this set, which limits me to replacing individual LED's, which I do not have the tools for at the moment. Anyone built their own LED test power supply? For a crude LED tester, I was thinking of using 120 v ac line voltage, a half wave rectifier, a 500 uf filter cap and a current limiting resistor. The half wave is so I don't exceed the 120 vdc, but will give more ripples. Full wave will have less ripples, but the voltage may end up at around 150 vdc. LED's are current driven devices. Maybe a full wave should be fine as long as my current limiting resistor is the correct value and not exceed the current rating of the LED's. How do I find the total LED current rating of my set? It's a 50" Toshiba 50L2300U. What is the approx. current to the LED's of a 50" TV? Also multimeter will beep or show 0ohm resistance if you find one shorted, or give OL / open circuit if that LED is dead. That's how i do it. Best solution to test the LED backlight is to turn the TV on with led backlight connected, you will automatically see which one of the LED is dead, preassuming power supply is okay. 07-30-2016, 08:09 AM #3 Member Join Date: Jul 2016 City & State: NYC My Country: USA I'm a: Knowledge Seeker Posts: 28 Re: LED backlight tester circuit But getting to the LED strips is a big job, which I am not ready to do, that's why I want to power them up with a test power supply. A multi-meter on the diode test mode can only test individual LED's, not when a bunch of them are in series as wired in a TV. I'm not sure if you can get a reading on a bunch of LED's in series even with the multi meter in the meg ohm scale. 07-30-2016, 08:24 AM #4 Senior Member Join Date: Mar 2011 City & State: Bacau My Country: Romania Line Voltage: 230V 50Hz I'm a: Hobbyist Tech Posts: 158 Re: LED backlight tester circuit In some cases depend on what multimeter you use. Some of them doesn't have over 3V on diode test. As result no chance to identify one bad led. Some of them still have over 3V voltage on diode test,so you can see a little light from led on test. But in case led inside is in fact two or three of them in same package,no chance to identify one bad led. 07-30-2016, 01:58 PM #5 Badcaps Veteran Join Date: Jun 2014 City & State: Overijssel My Country: The Netherlands Line Voltage: 230V I'm a: Professional Tech Posts: 1,906 Re: LED backlight tester circuit You can't repair the power supply of the tv? Whats the model number of the power supply? 07-30-2016, 02:05 PM #6 Member Join Date: Jul 2016 City & State: NYC My Country: USA I'm a: Knowledge Seeker Posts: 28 Re: LED backlight tester circuit Quote: Originally Posted by Moreno83 You can't repair the power supply of the tv? See this thread power supply board number is there. 09-03-2016, 07:29 AM #8 Senior Member Join Date: May 2015 City & State: Midland My Country: United States I'm a: Knowledge Seeker Posts: 159 Re: LED backlight tester circuit I just tried using a model train power supply to check led strips. My dc power supply has a max output of 17.6 volts. I can test up to 5 in a strip. 10 is to many for my power supply to power up. Has any one else found something like this to use? 09-03-2016, 10:23 PM #9 Badcaps Veteran Join Date: Nov 2013 City & State: scranton, pa My Country: usa I'm a: Knowledge Seeker Posts: 296 Re: LED backlight tester circuit 3AMEBIDX%3AIT Adjust to voltage needed for input and output. I currently use it for leds I made into nightlights for my sexy time bedroom...red light district wink wink!! I took tv leds and spray painted blood red, works awsome..... 09-03-2016, 11:17 PM #10 Badcaps Veteran Join Date: Feb 2010 City & State: S.F. You have to be real careful testing the LED strip without current limiter or constant current. So have 5 LEDs on the strip and you apply 17.6V directly without any current limiter, and if one of the LED shorted out, then the current flowing through the string will be so high that can damage the good LEDs. I use power supply that I can adjust the current. If you do not have one, you can use LM317 with heat sink as constant current source for driving LED. You can easily do the experiment and measure DCA through your LED string with your 17.6V power supply, then short out one of the LED to see what happen to the current and then look at the spec of the LED for the current handling. LED is not linear device. I do not understand why people keep trying to run the LEDs without any current limiting in place.
